

Django Crispy forms

Django Crispy forms is a package that helps us make forms more appear beautiful and also makes it easier to add customizable changes. It enhances the standard form capability by providing some pre-defined layout options such as bootstrap. Thus the form will automatically adapt to different screen sizes and ratios with additional work. Inorder to use the package in the project we need to install it using this command “**pip install django-crispy-forms**”. This will install the package. Then we have to add the installed package name into the settings.py file of the project. I will use this package in my project as it will reduce my effort to make forms responsive and highly functional.
