Django Pagination

In my project, the "Post" section will get the pagination feature. It will be better to load only a few posts per page so that the application loads faster. Loading a lot of data, especially with images makes the website slower, thus pagination will be a good choice. To test the features I will populate the database with 30 rows. On each page, I will load 5 posts. To generate test data values, I will enter them manually as I have to upload images. The migration part can be adapted by filling up other tables that does not require image upload.
